

## ABSTRACT OF THE INVENTION

The present invention concerns a device, an apparatus and a method for selecting a programme from a plurality of programmes which may be in a plurality of different data streams, which is able to select a programme from the plurality of programmes within the network based on operations of a manually operable means so that the specific manual operations of a single manually operable member is able to cause a selection of the programme from a plurality of programmes within one data stream and a selection of the data stream from the plurality of different data streams. Accordingly, the user of the network can select a desired programme very naturally without being conscious of the different data streams.
